

硬材料加工 金刚石和CBN

Ultra Hard Cutting Materials Diamond and Cubic Boron Nitride

2020

HORN 全新样本 – 以高效作为标杆

我们的刀具为您提供,快速,经济高质量的解决方案.从系列产品到单个零件,从标准到非标的应用.

- 槽加工
- Supermini 和 Mini 内孔加工
- 模块化系统
- 硬材料加工
- 铣削系统
- 钻孔/铰削
- 整体硬质合金立铣刀
- Boehlerit 铣削
- Boehlerit 车削

在每一个目录里,根据不同切削工艺区分,让您能快速的找到产品描述.
当您选定了特定的切削参数时,您会发现许多经验的数值表格.

New catalogues from HORN - benchmarks for productivity

Our tools provide you with fast, economical, high quality solutions, from single part to series production, for standard or special applications.

Our complete range of standard tools is summarised in the new catalogues

- Grooving
- Supermini & Mini Internal Machining
- Modular Holder Systems
- Ultra Hard Cutting Materials
- Milling Systems
- Drilling / Reaming
- Solid Carbide Mills
- Milling Catalogue Boehlerit
- Turning Catalogue Boehlerit

In each catalogue, the breakdown into the type of cutting process makes it easier for you to quickly find the products described. When choosing the individual cutting parameters, you will find numerous tables with proven empirical values.

C

D

超硬材料被定义为硬度超过硬质合金,金属陶瓷,切削陶瓷.根据这个定义,材料可以被分为以下两种不同的种类:

金刚石
立方氮化硼

金刚石切削材料可以被分成两个大类,单晶金刚石和多晶金刚石,而多晶金刚石可进一步分为两个子类别.

单晶金刚石,被用于精加工和超级精加工工序中.针对工件达到最佳的表面质量和最大化精准的槽型.高质量的切屑是成功的次要因素.

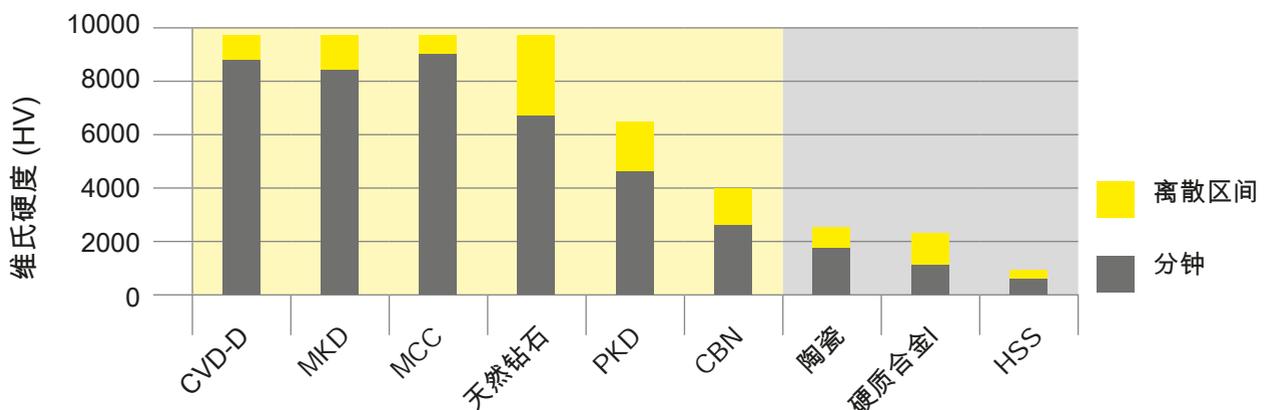

多晶金刚石切削材料,PCD和CVD-D两种主要的分类,不同于制造工艺及基体结构.

PCD 金刚石颗粒烧结于金属材料中的一种切削材料.每一个小颗粒为单晶金刚石.不同性能被制造由于不同的颗粒

CVD-D (化学气相沉积) 是气相沉淀. 后缀D表示层的厚度,被用于区别于普通的金刚石涂层. 层厚(0.3-1mm)一般取决于切削材料,结合于硬质合金刀具上.

PCBN(多晶立方氮化硼) 基体有着不同的性能由于不同的成分. 用于不同的特殊场合.

超硬切削材料

The term **ultra hard cutting materials** describes all cutting materials that are classified above carbides, cermets and cutting ceramics on the hardness scale. Within this definition, it is possible to differentiate between two groups:

Diamond cutting materials
PCBN substrates

Diamond cutting materials can be split into two main groups, monocrystalline and polycrystalline, whereby polycrystalline is then split into a further two subgroups.

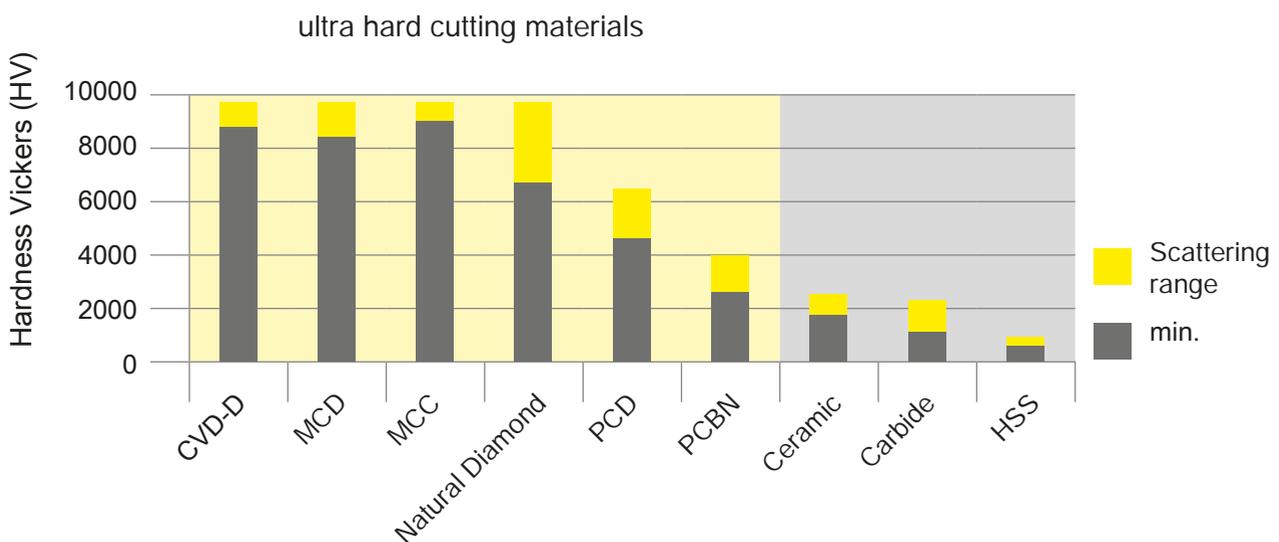

Monocrystalline diamonds are used in finishing and superfinishing processes. Optimum surfaces and maximum geometric accuracies for the components are the focus here. High chip volume is secondary to these criteria.

Polycrystalline diamond cutting materials, PCD and CVD-D differ primarily in terms of how they are manufactured and their structure.

PCD describes a cutting material group in which the diamonds are sintered as grains in a metal matrix. Each individual grain is itself monocrystalline. Different properties are produced due to the variation of the grains.

CVD-D (chemical vapour deposition) is deposited from the gas phase. The suffix "D" stands for thick film and is used to differentiate it from conventional diamond coating. Thick film describes the thickness (0.3 - 1 mm) of the cutting material that is soldered to the carbide toolholder for further processing.

PCBN (polycrystalline cubic boron nitride) substrates have different properties due to their composition. These are configured specifically for the application

选择正确的应用是重要的,当切削中最大发挥PCBN及金刚石切削材料的最大潜力.

高级别的金刚石硬材料,它主要有PCD,MCD,CVD-D及天然金刚石. 在一些特殊要求的加工任务中,金刚石可以使用锋利的切削刃口从而代替普通的加工材料.

这类材料具有良好的抗热磨损同时保持高的硬度,这个是仅次于金刚石,PCBN(多晶立方氮化硼)是理想的淬硬钢加工材料. 不同的PCBN基材在其组成以及由此产生的机械和化学性能方面有所不同.另外加工硬化钢(45-70 HRC),这种切削材料组也非常适合加工铸造材料和特殊合金--碳化物和切削陶瓷经常达到极限的一种应用.

各种超硬切削材料的组成结构可根据不同的任务进行优化.因此,选择合适的切割材料,结合合适的几何槽型是非常重要的.

推荐的切削参数是能够实现有效结果和断屑的关键数据.在每一种情况下,都需要使参数适应整体的加工情况.

为了达到尽可能好的效果,必须考虑整个加工环境,并使其达到尽可能高的稳定性.机床的结构、导轨、主轴以及工件和刀具的夹紧系统对加工效果起着至关重要的作用.

Choosing the right application is crucial when it comes to maximising the huge potential of PCBN and diamond cutting materials in manufacturing.

The high level of hardness of diamond in its various forms such as PCD, MCD, CVD-D or natural diamond and the resulting cutting edge sharpness may mean that a different approach to the one taken with conventional cutting materials may be required depending on the machining task in question.

Its high heat resistance combined with the high level of hardness, which is second only to diamond, makes PCBN (polycrystalline cubic boron nitride) the ideal cutting material for machining hardened steels. The different PCBN substrates vary in terms of their composition and the resulting mechanical and chemical properties. In addition to the machining of hardened steels (45-70 HRC), this cutting material group is also highly suited to the machining of cast materials and special alloys – an application where carbides and cutting ceramics often reach their limits.

The composition and/or structure of the various ultra-hard cutting materials are optimised for different tasks. Therefore, it is extremely important that the right type of cutting material in combination with the right cutting geometry is selected.

The recommended cutting parameters are the key data that enable an efficient result and/or chip break to be achieved. In each case, it is necessary to adapt the parameters to the machining situation as a whole.

In order to achieve the best results possible, the entire machine environment must be taken into account and brought to the highest level of stability possible. The structure of the machine, guides, spindles and the clamping systems for the workpiece and tools play a key role with respect to the result.

不是所有的PCD都一样

Not all PCD is the same

PCD是一种复合切削材料.金刚石颗粒，每一个单晶的性质，是烧结彼此在一个金属基体(一般为钴).在烧结过程中，晶粒在晶体内生长，单个晶粒在一定程度上共同生长,从而影响材料在使用过程中的磨损性能.

除了烧结工艺外，所使用的晶粒尺寸和质量也是衡量耐磨性的一个指标.可以推导出以下理论原理:"颗粒越大，耐磨性越好".然而，这损害了可以达到的尖端质量，削片和锐度.不考虑用于生产切削刃的制造技术.金属结合相的体积分数百分比也会增加，并产生负作用.

HORN高性能PCD是由复杂的混合不同的钻石颗粒大小.金刚石的体积分数增加，有效硬度、韧性和切削质量增加.毫无疑问，严格的质量标准得到了遵守和监控，确保了最高的性能.

PCD is a compound cutting material. Diamond grains, each one of a monocrystalline nature, are sintered to each other in a metal matrix, generally cobalt. During the sintering process, the grains grow within the crystals and the individual grains grow together to a limited extent, thereby affecting the wear properties during subsequent use.

In addition to the sintering technology, the size and quality of the grains used are an indicator of wear resistance. It is possible to derive the following theoretical principle: "the larger the grain, the better the abrasion resistance". However, this compromises the cutting edge quality, chipping and sharpness that can be achieved, irrespective of the manufacturing technology used to produce the cutting edges. The percentage volume fraction of the metallic binding phase also increases and has a negative effect.

HORN high-performance PCD is comprised of a sophisticated mixture of different diamond grain sizes. The volume fraction of diamond increases, as do effective hardness, toughness and cutting quality. It goes without saying that strict quality standards are observed and monitored and ensure maximum performance.

CVD-D的耐磨性显著高于PCD. 其原因是, 它没有一个金属结合倒角, 而事实是, 它有一个结果钻石成分几乎百分之百. 单个的单晶金刚石颗粒从气体中沉积下来, 并一起生长, 因此它们不能被分离, 形成一个固体的聚合物金刚石层.

过程类似于金刚石涂层硬质合金工具, 但层厚度只有几 μm 厚, 因此相对较短的时间在使用后损坏

除了最大硬度, 金刚石的其他积极性能也有利于加工过程. 其特殊的导热性, 确保冷却切割. 摩擦系数低, 粘接倾向低, 可有效防止堆积物边缘形成. 即使使用关键的铝合金, 也可以在不使用冷却润滑剂的情况下进行可靠的加工.

激光技术是必不可少的, 当涉及到制造CVD-D切削刃. 如果没有这项技术, 就不可能实现高切削质量和切屑形状的槽型. 可达到的表面质量明显优于PCD生产的切削刃. 由于其物理性能的原因, 其断裂韧性较低, 在一定程度上限制了材料的使用.

可达到的刀具寿命是PCD刀具的两倍或几倍.

The wear resistance of CVD-D significantly exceeds that of PCD. The reason for this is that it does not have a metallic binding chamfer and the fact that it has a resulting diamond component of almost 100 per cent. Individual, monocrystalline diamond grains are deposited from gas and grow together so that they cannot be separated to form a solid, polymeric diamond layer.

The process is similar to the diamond coating of carbide tools but the layer thickness is just a few μm thick and is therefore worn away after a relatively short time in use.

In addition to maximum hardness, other positive properties of diamond also benefit the machining process. Its special heat conductivity ensures cool cutting. The low coefficient of friction and a low adhesive tendency reliably prevent build-up edges from forming. Reliable machining processes can be performed even with critical aluminium wrought alloys without using cooling lubricant.

Laser technology is indispensable when it comes to manufacturing CVD-D cutting edges. It would simply be impossible to achieve the high cutting quality and apply chip shape geometries without this technology. The surface qualities that can be achieved are significantly better than those of cutting edges produced from PCD. Only its lower fracture toughness, which is due to its physical properties, limits the use of the material to some extent.

The achievable tool life is double or several times that of tools manufactured from PCD.

HORN 3D-断屑器

HORN 3D chip breaker

规格	HORN 3D-断屑器		前角	性能
HF	普通		25 - 30°	针对孔加工的槽型 推荐,过孔直径50%大于刀具直径
HS	精加工	焊接刀尖	25 - 30°	精加工到中等加工,绝对锋利切削刃口,正前角,在加工多数脆性材料有低的切削力
HN	普通/ 粗加工		15 - 25°	各种用途的中型加工,强壮的切削刃口,大切深和高进给率.
G.HS	精加工	PCD沿整体硬质合金刀片的切削刃	25 - 30°	精加工到中等加工,绝对锋利切削刃口,正前角,在加工多数脆性材料有低的切削力
G.HN	普通/ 粗加工		15 - 25°	各种用途的中型加工,强壮的切削刃口,大切深和高进给率.
F.HS	精加工	全面的	25 - 30°	精加工到中等加工,绝对锋利切削刃口,正前角,在加工多数脆性材料有低的切削力
F.HN	普通/ 粗加工		15 - 25°	各种用途的中型加工,强壮的切削刃口,大切深和高进给率.
W.HS	精加工	修光刃槽型	25 - 30°	2 - 4 倍进给率,见D5
W.HN	普通/ 粗加工		15 - 25°	2 - 4 倍进给率,见D5

Specifica- tion	HORN 3D chip breaker		Chip angle	Properties
HF	normal		25 - 30°	Geometry for machining of bors, Recommendation: Bore diameter 50% greater than tool diameter
HS	finishing	Edge tipped	25 - 30°	Fine to medium machining, absolute sharp cutting edge, positive cut, lowest cutting force on most fragile components
HN	normal/ roughing		15 - 25°	Medium machining for all purpose, strongest cutting edge, for high depth of cut and feed rates
G.HS	finishing	PCD along the whole cutting edge of the solid carbide insert	25 - 30°	Fine to medium machining, absolute sharp cutting edge, positive cut, lowest cutting force on most fragile components
G.HN	normal/ roughing		15 - 25°	Medium machining for all purpose, strongest cutting edge, for high depth of cut and feed rates
F.HS	finishing	Full face	25 - 30°	Fine to medium machining, absolute sharp cutting edge, positive cut, lowest cutting force on most fragile components
F.HN	normal/ roughing		15 - 25°	Medium machining for all purpose, strongest cutting edge, for high depth of cut and feed rates
W.HS	finishing	Wiper Geometries	25 - 30°	2 - 4 times higher feed rate, see page D5
W.HN	normal/ roughing		15 - 25°	2 - 4 times higher feed rate, see page D5

使用带HORN 3D-断屑器刀片时, 请注意以下事项:

- 找到切削深度和进给速度的正确组合,以获得完美的切屑控制.
- 内孔车削时, 应只使用中置刀杆(径向角为0°的刀片). 特别是在使用HS槽型刀片时,由于槽型的设计, 在某些情况下会导致切削刃的机械力过大.
- 对于退刀槽和底切时,当两个切削刃同时在切割时,不应使用HS. 究其原因,槽型为小切深而设计的断屑器.

When using inserts with HORN 3D chip breaker please observe the following:

- Find the right combination of depth of cut and feed rate in order to obtain perfect chip control.
- When turning internal, you should use only neutral tool holder (radial angle of the insert 0°). In particular with the chip breaker HS in some cases it can come to a mechanical overstress of the cutting edge because of the design of the chip breaker.
- For relief grooves and undercuts, where both of the cutting edges are in cut at the same time, you should not use HS. The reason is in the geometrical design of the chip breaker for lowest depth of cuts. Chips may build up, this can lead to mechanical overstress and breakage of the cutting edge.

切削材料结合切屑槽型,是成功的关键

CVD-D和PCD是加工铝、镁合金、其他有色金属、各种塑料复合材料和硬质合金等特殊磨料的首选材料,包括预烧结材料和终烧结材料.

将金刚石切削刃的经济刀具寿命与HORN切屑槽型.HF, .HN 和.HS 相结合, 形成一套优化的切削系统

这一发展开辟了更多的应用领域,提高了加工铝合金的可靠性、速度和精度,从而大大提高了生产效率.即使毛刺的形成是更换刀具的主要标准, .HS槽型的锋利切削刃也能使刀具寿命延长2.5到4倍.

注意:

目录中规定的 l_1 长度为槽型的有效工作长度. 不同金刚石加工材料的描述见D6页,切削参数见A50-A51页..

Cutting material in conjunction with chip shape geometry, the key to success

CVD-D and PCD are the materials of choice for machining aluminium and magnesium alloys, other non-ferrous metals, all plastic composite materials and abrasive special materials, such as carbides, both pre-sintered and final-sintered.

The economical tool lives of diamond cutting edges are combined with the .HF, .HN and .HS HORN chip shape geometries to form an optimum cutting system.

This development opens up additional areas of application and improves the machining of aluminium wrought alloys with respect to process reliability, speed and precision, thereby significantly increasing manufacturing efficiency. Even when burr formation is the main criteria for changing a tool, the sharp cutting edges of the .HS geometry enable the tool life to be increased by between 2.5 and 4 times.

Notes:

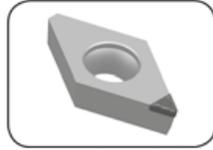

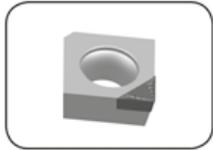

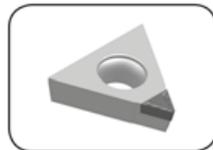

The length l_1 specified in the catalogue is the effective length of the chip shape geometry. The description of the different diamond cutting materials can be found on page D6 for cutting data please see pages A50-A51.

请考虑切深 a_p 这与刀具主偏角有关系. $HS / HN = l_1$ 根据槽型的有效长度!

Please consider the a_p in relation to the approach angle of the toolholder.
 $HS / HN = l_1$ is according to the effective length of the geometry!

精密磨削端面刃口

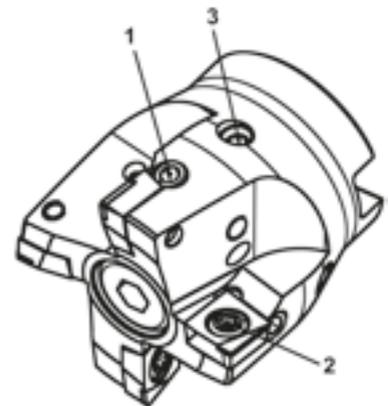

(调整范围 max. +/- 0,05)

- 去除调整键(位置.1)至最初位置
→ 标记槽大约在11点钟方向
- 安装刀片DTS... 至刀片座,使用 Torx-Plus 扳手 T15 (位置.2)
→ 将调节销(位置1)前后转动,并以最小扭矩同步插入刀片座同时压住刀片. 那么就可以找到最大的调整范围。
→ 使用Torx-Plus 扳手 T15PQ (位置.2) 夹紧扭矩 3,0 Nm
- 检查并调整所有切削刃的轴向跳动
→ 确定最高切削刃. 顺时针旋转调节销(位置1)至0.02mm (这就是最高切削刃).
→ 调整其余切削刃直到满足轴向跳动.
→ 调整: $10^\circ = 0,01 \text{ mm}$
- 请不要回退调整键, 这意味着刀片离开了下方的夹具, 在这种情况下可能重复调整的步骤
- 检查所有切削刃的轴向跳动
- 如有必要, 使用M5螺丝对系统进行精密平衡 (位置.3)
→ 平头螺钉自锁

Precision machining face cutting edges

(Max. adjustment range +/- 0,05 mm)

- Move the adjusting pins (item 1) to the initial position
→ Marking groove at approx. „ 11 clock“
- Install the inserts DTS... in the insert seat using a Torx screw (item 2)
→ Turn the adjusting pin (item 1) to and fro and synchronous press the insert with minimal torque into the insert seat. So the maximum adjusting range will be found.
→ Tighten the Torx screw T15PQ with torque of 3 Nm
- Check and adjust the axial runout of all cutting edges
→ Determine the highest cutting edge. Turn the adjusting pin (item1) clockwise up to 0,02mm (so it is the highest cutting edge)
→ Adjust the remaining cutting edges until the required axial runout is achieved
→ Adjustment: $10^\circ = 0,01 \text{ mm}$
- Don't turn back the adjusting pins, it means the insert leave below the fixture, in the case maybe repeat the procedure of adjustment
- Check the axial runout of all cutting edges
- If necessary, fine balance the system using the M5 screw (item3)
→ Grub screw are self-locking

**CVD-D 和 PCD 刀片
配 HORN 3D-槽型**

铣刀盘详见铣削样本,章M

**CVD-D and PCD tipped
with HORN 3D geometries**

For milling cutter please see our
catalog Millingsystems, Chapter M

HORN的DA32铣削系统首次扩展了精钢石镶片刀片。当进行方肩铣，面铣，破走铣和仿形铣时，这特点使刀具能实得到出色的结果。

大正前角槽型刀片确保了特别平滑的切削。这使得施加在工件和刀具上的应力最小，因此，长刀具寿命和几乎无毛刺的加工是有保证的，特别是在长切削材料。底部大圆弧精加工修光刃创造了最好的表面质量标准，即使在高进给率下。冷却剂供应可靠地确保对准切削刃冷却，以及安全去除的切屑离开工作区域。

得益于对纤维增强塑料的特殊槽型，结合CVD厚贴片的金刚石刀具材质的硬度和耐磨性，取得了杰出的成绩。经过试验和测试的HORN金刚石基体，确保使用最先进的激光技术生产的切屑刃口

能够有效地工作吗??

所有这一切，结合淬火和回火高硬度钢的TiN涂层抗磨刀杆。各类TiN涂层的刀杆，是DA系统真正发挥作用的地方。DA32系统中的刀头、螺纹端铣刀和立铣刀的直径从20毫米到63毫米不等，并有2到6个切削刃。

HORN's proven DA32 Milling system is extended for the first time with diamond-tipped inserts. This feature allows the tools to achieve outstanding results during shoulder milling, face milling, plunge milling and circular milling.

The highly positive geometry of the inserts ensures a particularly smooth cut. This keeps the stress exerted on the workpiece and the tool to a minimum. As a result, a long tool life and virtually burr-free machining are guaranteed – particularly when it comes to long-chipping materials. The wide finishing radius creates the very best standards of surface quality, even at high feed rates. The coolant supply reliably ensures targeted cooling of the cutting edges as well as safe removal of the chips away from the working zone.

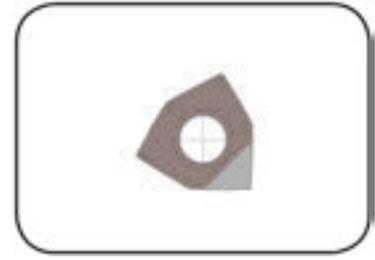

Thanks to the special geometry for fibre-reinforced plastics, combined with the hardness and wear resistance of the CVD thick-film diamond cutting material, outstanding levels of performance are achieved. Tried-and-tested HORN diamond substrates guarantee that the cutting edges – produced using state-of-the-art laser technology

– are able to work efficiently.

All this, combined with the exceptional rigidity of the quenched and tempered steel as well as the wear-resistant TiN coating of the various tool holders, is what really makes the benefits of the DA system come into their own. The cutter head, screwed end milling cutter and the end mill in the DA32 system are available in cutting edge diameters from 20 mm to 63 mm and with between two and six DA32 inserts.

Dimensions in mm

注意事项 :

Note:

硬质合金牌号
Carbide grades

Z = 齿数
Number of teeth

d = 直径-Ø
Cutting edge Ø

n = 转速
Revolutions

$$n = \frac{v_c \cdot 1000}{d \cdot \pi} \text{ [1/min]}$$

v_c = 切削速度
Cutting speed

$$v_c = \frac{d \cdot \pi \cdot n}{1000} \text{ [m/min]}$$

f_z = 进给/齿
Feed/tooth

$$f_z = \frac{v_f}{Z \cdot n} \text{ [mm]}$$

v_f = 进给率
Feed rate

$$v_f = f_z \cdot Z \cdot n \text{ [mm/min]}$$

Q = 金属去除率
Material removal rate

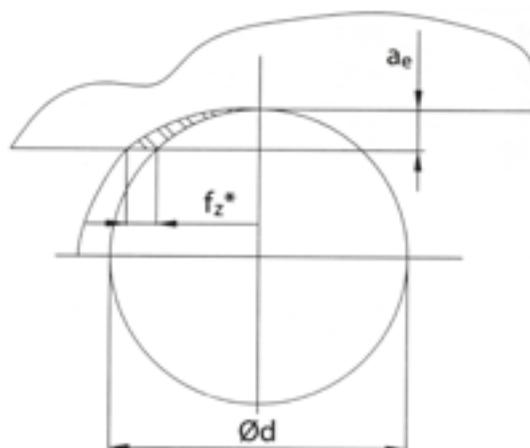

$$Q = \frac{a_e \cdot a_p \cdot v_f}{1000} \text{ (cm}^3\text{/min)}$$

小切削深度的肩铣需要根据以下公式对进刀速度 f'_z 进行补偿。
根据切削深度和刀具直径的不同，该值往往比常规进刀率高得多。

Shoulder Milling with a small depth of cut requires a compensation of the feedrate f'_z according to the following formula.
This value is often much higher than the regular feedrate depending on the depth of cut and the cutter diameter.

f'_z = 有效 a_e 侧边铣 (至多 $0,25 \cdot d$):
effective for side Milling with small a_e (up to $0,25 \cdot d$):

$$f'_z = f_z \sqrt{\frac{d}{a_e}} \text{ [mm]}$$

with MCD

一流的刀具刃口

除了单晶金刚石所表现出的高硬度外，非晶结构是几何决定切削刃的超精密和高精度加工的基本要求。极其锋利和完美的切削刃允许 $< Rz\ 0.02\ \mu\text{m}$ 的表面质量。切削刃的质量完美地反映了所能达到的表面质量。

当谈到制造工具时，特别注意的是单晶金刚石的晶体系统的基体及方向相的硬度值。这是确保实现最大刀具寿命的唯一方法。对切削刃的几何设计进行了优化，以适应加工材料的要求。MCD工具适用于有色金属及其合金、贵金属(如金和铂)或透明塑料(如PMMA和PC)的精加工。

黑色金属和纤维增强塑料一般不适合用单晶金刚石加工。

大量标准范围的库存MCD刀具,用于车削和铣削。

Top-class tool cutting edges

In addition to the high level of hardness demonstrated by monocrystalline diamonds, the amorphous structure in particular is a basic requirement for ultra-precision and high-precision machining with geometrically determined cutting edges. The extremely sharp and flawless cutting edges allow for surface accuracies of $< Rz\ 0.02\ \mu\text{m}$. The quality of the cutting edge perfectly reflects the surface quality that can be achieved.

When it comes to manufacturing tools, particular attention is paid to the crystal-system-based, direction-dependent hardness values of monocrystalline diamonds. This is the only way of ensuring that the maximum tool life is achieved. The geometric design of the cutting edge is optimised for the materials to be machined.

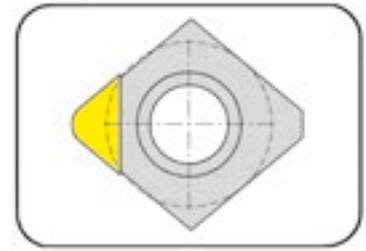

MCD tools are ideally suited to finishing processes for non-ferrous metals and their alloys, precious metals such as gold and platinum or transparent plastics such as PMMA and PC.

Ferrous metals and fibre-reinforced plastics are generally not suitable for machining with monocrystalline diamond.

An extensive standard range of MCD tools for turning and milling are available from stock.

刀杆详见Supermini® & Mini 样本

Hard Boring
with PCBN

For toolholder please see our
catalog Supermini® & Mini

聚晶立方氮化硼是仅次于金刚石的第二硬材料，其物理、机械和化学性质的独特结合是其特点。刀片的高耐热性和硬度能达到最大效率，特别是当加工淬硬钢时并配合具有槽型的切削刃。然而加工中,工件与刀具中的金刚石或碳化硅产生化学反应,让刀具受到钝化的影响。这一特性使得除淬火钢外的各种材料也可以加工。因此，PCBN被认为是一种经济的切削材料，可以成功地用于加工铸铁、白铁和烧结材料以及精密加工高温合金。

PCBN基材被用于切削复合体系的材料。不同的体积分数、晶粒尺寸和结合剂,体系中导致了非常不同的性能，这些性能可以根据不同的应用而得到很大的利用。通常根据其体积分数来区分PCBN基材。这是最重要的指标，也可以在ISO标准513中找到。PCBN基材的相互作用、切削刃的槽型设计、优化切削值和稳定的刀具系统使得材料去除率、精度和高表面质量优于磨削技术。在极少数的情况下，需要专用的机床。

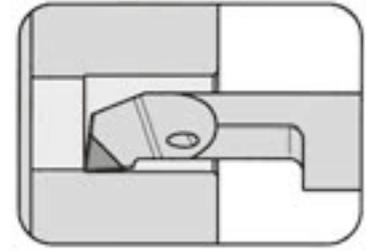

CB07	稳定和轻断续工况下,加工(45-70HRC)淬硬钢
CB10	Hard machining of steel (45-70 HRC) with a smooth and lightly interrupted cut
CB50	重断续工况下,加工(45-70HRC)淬硬钢
	Hard machining of steel (45-70 HRC) with a heavily interrupted cut
	铸铁加工
	Cast iron machining
	烧结材料,高温合金精加工.
	Sintered materials, precision machining of superalloys

Polycrystalline cubic boron nitride, the second hardest material after diamond, is characterised by a unique combination of physical, mechanical and chemical properties. Its high thermal resistance and hardness in particular enable maximum efficiency when machining hardened steel with geometrically determined cutting edges. Yet its chemical interaction with metals is also influenced by passivity, which is in contrast to diamond or silicon carbide. This property allows a wide range of materials other than hardened steel to also be machined. As a result, PCBN is regarded as an economical cutting material that can successfully be used in machining cast iron, white iron and sintered materials and in precision machining superalloys.

PCBN substrates are used as cutting material composite systems. The variation in their volume fraction, grain size and binder system results in very different properties, which can be used to great advantage depending on the application in question. PCBN substrates are generally differentiated based on their volume fraction. This is the most important index and can also be found in ISO standard 513. The interaction of PCBN substrate, geometric design of the cutting edge, optimum cutting values and a stable tool system allow material removal rates, accuracies and high surface qualities to be achieved that are superior to grinding technology. In very rare cases, special machines will be required.

使用修光刃的表面质量

Surface quality with Wiper-Geometry

为了满足车削和铣削加工中要求的更佳表面质量，我们开发了很多种带有修光几何槽型的刀片。该类槽型在刀尖圆角和横向切削刃之间有一个后缘，其类似于切削角0°的切削刃。即使在2-4倍大的进给率下也能得到同样的表面质量。通过降低循环周期，更高进给率下最佳的切削控制和刀具寿命的增加，您能逐步提高产能同时降低成本。

使用修光槽型时请注意：

接近角 需要准确应用,以便得到最好的修光效果,使表面质量最佳.

$$\text{CCGW} / \text{T} = 95^\circ \quad \text{DCGW} / \text{T} = 93^\circ$$

注意切削方向。修光槽型被设计作用于切削刃之后，以得到良好的切屑流和表面质量。端面加工方向应从大径到小径。由于后缘，失真可能出现在圆角，倒角和锥形面上。

修光槽型的优点:

- 同样的切削参数下更佳表面质量
- 更高的进给率-可使用同一刀片进行粗加工和精加工
- 通过更高进给实现更佳的切屑控制
- 更高的进给率降低了每个工件的切削时间，并提高了耐磨性和刀具寿命。

For the purpose of high performance cutting in the fields turning and milling, we developed a large number of inserts with WIPER geometry. Those geometries are designed with a trailing edge between edge radius and lateral cutting edge, which works like a cutting edge with 0° approach angle. Even with 2 - 4 times higher feed rates you can achieve the same surface qualities. Through reduction of cycle time, the optimal chip control with higher feed rates and the increase of tool life, you can escalate your productivity while reducing costs at the same time.

Please keep in mind when using Wiper Geometries:

The **approach angle** needs to be applied accurately, in order to achieve the desired wiper effect to get best surface qualities:

$$\text{CCGW} / \text{T} = 95^\circ \quad \text{DCGW} / \text{T} = 93^\circ$$

Be aware of the cutting direction. Wiper geometries are designed to trail behind the cutting edge for proper chip flow and surface quality.

Facing operations should always be performed from the larger to smaller diameter.

Because of the trailing edge, **distortion** can occur on radii, chamfers and tapers.

Advantages of Wiper Geometries:

- Better surface qualities at the same cutting parameters
- Higher feed rates - Roughing and finishing with one insert is possible
- Better chip control through higher feed rates
- Higher feed rates reduces the cutting time per workpiece and therefore the wear characteristic and this leads to significantly longer tool life

旋转不平衡是质量沿旋转轴的不均匀分布.当质量中心(惯性轴)与旋转中心(几何轴)不对齐时,就会引起不平衡。
来源: <http://de.wikipedia.org/wiki/Unwucht>

与先进的工具主轴相关联的高速意味着所使用的工具需要与它们的支持相平衡.如果做不到这一点,就会对表面质量产生影响,这不仅会影响工具的使用寿命,对达到完美的效果也是至关重要的.特别是在抛光和精加工方面.对于较大的质量或较大的直径,即使在相对较低的速度下工作,也必须考虑任何不平衡的影响.

静态不平衡和动态不平衡是有区别的.当转子的重心在旋转轴外时,就会发生静力不平衡.

对于短工具,高扭矩值不能发展,这意味着在一个平面上平衡通常是足够的(静态).

我们的工具在CAD阶段被设计成平衡的.在实践中,这意味着在理论设计阶段要考虑质量比及其偏移量.这是一个展示我们的质量的特性,并且是一种无需额外工作就能达到所需平衡的方法.然而,这项措施并没有取代平衡整个系统的需要.

Rotating Unbalance is the uneven distribution of mass around an axis of rotation. Unbalance is caused when the centre of mass (inertia axis) is out of alignment with the centre of rotation (geometric axis)....

source: <http://de.wikipedia.org/wiki/Unwucht>

The high speeds associated with state-of-the-art tool spindles mean that the tools used need to be balanced with their supports. Failure to do this has an impact on the surface qualities that can be achieved as well as on tool life - this can be crucial when it comes to achieving a perfect result, particularly with respect to polishing and brilliant finish machining. With large masses and/or large diameters, the effects of any unbalance must be taken into account even when working at relatively low speeds.

A distinction is drawn between static unbalance and dynamic unbalance. Static unbalance occurs when the rotor's centre of gravity is outside the rotary axis.

With short tools, high torque values cannot develop meaning that balancing in one plane is often sufficient here (static).

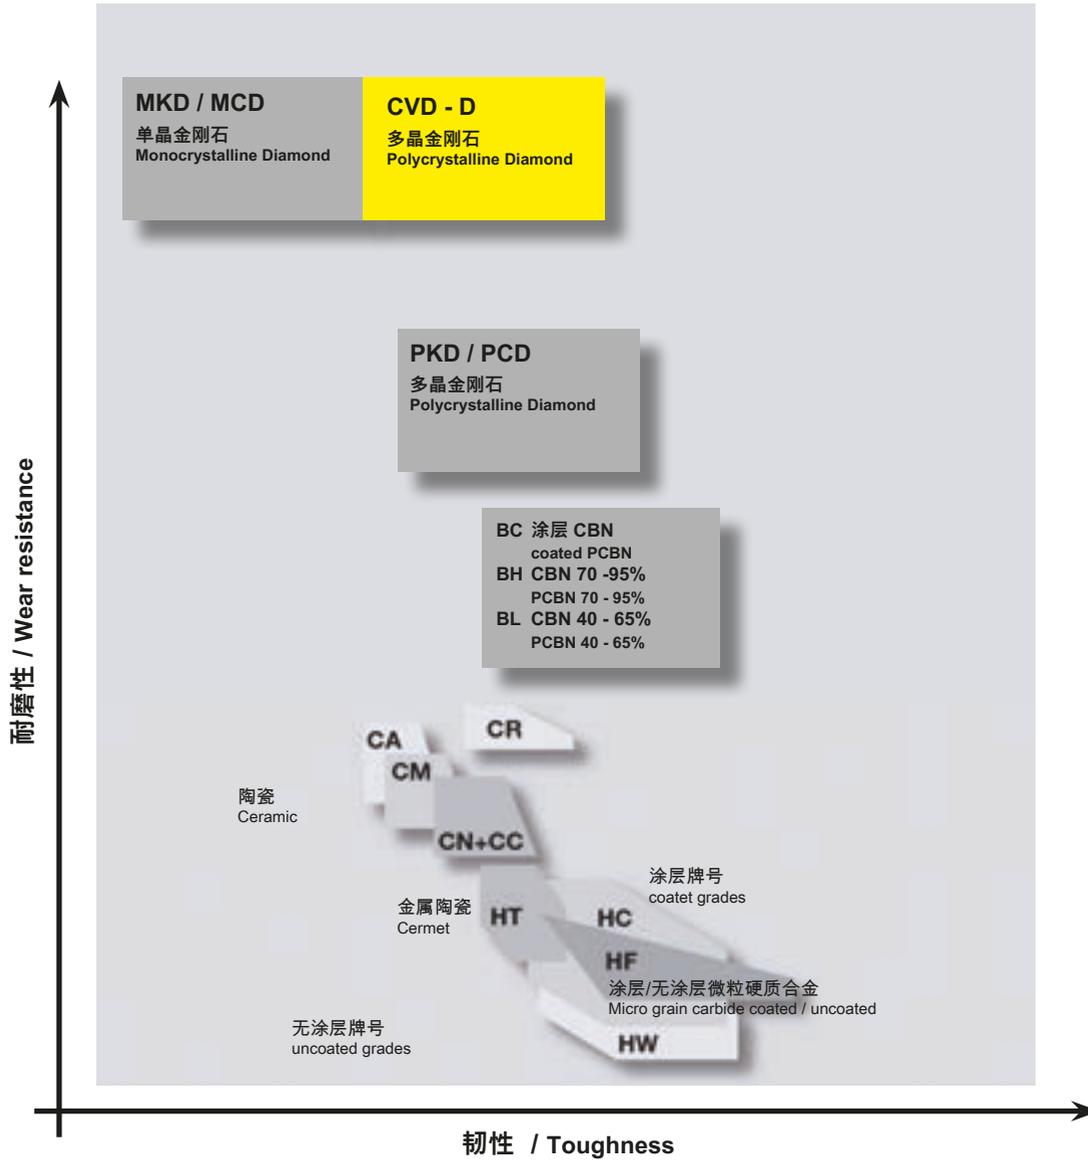

Our tools are designed to be balanced at the CAD stage. In practice, this means that the mass ratios and their offsets are considered during the theoretical design phase. This is a feature that demonstrates our quality and is a way of achieving the required balance without the need for additional work. Nevertheless, this measure does not replace the need to balance the system as a whole.

D

HORN-材质	切削材料	性	能推荐应用
MD10	MKD	固体单晶金刚石 无粒状组织，极高硬度，无微型裂口的极其锋利的切削刃，低韧性。	所有有色金属、无磨料增强塑料、贵金属和贵重合金的抛光和高抛光加工
HD03 HD05 HD08	CVD-D	CVD金刚石 (多晶金刚石基材) 无整体硬质合金材质并无金属粘结剂。99.9%金刚石，非常高的硬度和耐磨性，无微型裂口使切削刃更锋利，韧性也得到提高。	加工所有有色金属、铝合金、耐磨增强塑料、贵重合金、硬质合金、陶瓷绿色零件
PD02	PKD	多晶金刚石，平均晶粒尺寸 最大韧性，耐磨性好	加工所有有色金属，最适合用于困难工况
PD70	PKD	多晶金刚石，混合晶粒 整体硬质合金强化，粒度细，切削刃锋利度好， 最高的耐磨性和韧性	适用于所有有色金属和塑料的研磨增强材料，从精加工到粗加工
PD75	PKD	多晶金刚石，微晶粒 整体硬质合金强化，粒度细，切削刃锋利性好，提高耐磨性和韧性	适用于所有有色金属和塑料的耐磨增强材料，超细精加工和从精加工到粗加工

HORN-Grades	Cutting material	Properties	Recommended applications
MD10	MCD	Solid Monocrystalline Diamond without grain structure, highest hardness, absolutely sharp cutting edge without micro fractures, low toughness	Polish and high polish machining of all nonferrous metals, plastics without abrasive reinforcements, precious metals and precious alloys
HD03 HD05 HD08	CVD-D	CVD Diamond (Polycrystalline Diamond substrate) without solid carbide material and without metallic binder. 99.5% Diamond, Highest hardness and wear resistance, sharp cutting edge without micro fractures, improved toughness	Machining of all nonferrous metals, Aluminium alloys, Plastics with abrasive reinforcements, precious alloys, Solid Carbide, Ceramic green parts
PD02	PKD	Polycrystalline Diamond, average grain size maximum toughness with good wear resistance	Machining of all nonferrous metals, preferably used for difficult operations
PD70	PCD	Polycrystalline Diamond, mixed grain solid carbide reinforced, fine grit size, good cutting edge sharpness, highest wear resistance and toughness	All purpose for all nonferrous metals and plastics with abrasive reinforcements, from finishing to roughing
PD75	PCD	Polycrystalline Diamond, micro grain solid carbide reinforced, fine grit size, very good cutting edge sharpness, improved wear resistance and toughness	All purpose for all nonferrous metals and plastics with abrasive reinforcements, ultra fine finishing and from finishing to roughing

Plus

刀头-Torx螺钉

刀头： 高品质铬钒钢，硬化处理，镀铬
Wiha镀铬刀头保证了最好的精密度。
颜色代码为绿色

用途： 拧紧螺钉到指定扭矩，和Wiha扭矩扳手刀柄组合。

Blade for TORX-Plus® screws

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Wiha Chrome Blade guarantees maximum precision.
Colored code dark green

Utilization: Controlled screw setting with definite torque in combination with Wiha torque screw driver handle.

T9PW
T10PW
T15PW
T20PW

配 / for
D041VL / D15VL / D28VL

Plus

刀头-TORX PLUS®螺钉

用途： 适合所有的TORX PLUS®螺钉. 注意:不能用于Torx螺钉

Wrench for TORX PLUS® Screws

Utilization: For all kind of using TORX PLUS® Screws

Attention: TORX PLUS®-Wrench does NOT fit for Torx-Screws

DSW20K
DSW25K
DSW30K
DSW40K

配 / for
D041VL / D15VL / D28VL

扳手刀头-内六角螺钉

刀头： 高品质的铬钒钢，硬化处理，镀铬。
Wiha镀铬刀片保证了最好的精密度。
使用红色代码

应用： 使用给定的扭紧扭矩，结合一个Wiha扭矩手。

Blade for allen screws

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Wiha Chrome Blade guarantees maximum precision.
Colored code red

Utilization: Controlled screw setting with definite torque in combination with Wiha torque screw driver handle

D

D14ZBK

配 / for
D041VL / D15VL / D28VL

通用钻套

适用于所有的C6.3和E6.3(1/4")钻头

刀头：高品质铬钒钢，经硬化处理，镀铬

刀颈：不锈钢

应用：可与扭矩螺丝刀手柄组合使用，具有一定扭矩，可控制螺杆设定。

Universal Bitholder for C6,3 and E6,3 (1/4") Bits

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Collar: Stainless steel

Utilization: For controlled screw setting with definite torque in combination with torque screw driver handle.

D

D515QL

5-15 Nm

带刻度的扭矩扳手

-扭矩可调

-屏幕显示调整扭矩

扭矩无极调节，符合人体工程学的多组件手柄，轻而紧凑的设计，当达到设定扭矩时单击信号按钮。

(标准: EN ISO 6798, BS EN 26789, ASME B 107.14.M.)

(精度: $\pm 6\%$)

Torque screw driver with scale

- variable torque setting

- adjusted torque is shown on display

The Torque can be adjusted with a special torque setter (included).

Ergonomical form gives perfect handling abilities. Audible signal when set torque is reached.

(Standard: EN ISO 6798, BS EN 26789, ASME B 107.14.M.)

(Precision: $\pm 6\%$)

ED515QL

配 / for
D515QL

扭矩调整扳手

柄部：纤维素乙酸酯微观结构表面

刃部：八角形状，经过硬化处理，镀铬

Device for setting the required torque.

Handle: Celluloseacetat with micro structured surface

Blade: Octogonal (8 flats) blade, hardened galvanized

Blade for TORX-Plus® screws

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Wiha Chrome Blade guarantees maximum precision.
Colored code dark green

Utilization: Controlled screw setting with definite torque in combination with Wiha torque screw driver handle.

D14ZBQ

配 / for
D515QL

通用钻套

也用于所有的C6.3和E6.3(1/4")钻头

刀头：高品质铬钒钢，经过硬化处理，镀铬。

刀颈：不锈钢

应用：用于固定扭矩，扭矩标与柄部。

Universal Bitholder

for C6,3 and E6,3 (1/4") Bits

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Collar: Stainless steel

Utilization: For controlled screw setting with definite torque in combination with torque screw driver handle.

14ZQK

通用T型刀柄的钻套

用于所有的C6.3和E6.3(1/4")钻头

刀头：高品质铬钒钢，经硬化处理，镀铬

刀颈：不锈钢

应用：开关控制

Universal Bitholder with T-handle

for C6,3 and E6,3 (1/4") Bits

Blade: High quality Chrome-Vanadium steel, through hardened, chrome plated.

Collar: Stainless steel

Utilization: For controlled opening

加工材料组 nach DIN ISO 513

Cutting Material Groups per DIN ISO 513

组别 Main group	标志	子组别 Subgroups
硬质合金 Carbide	HW	非涂层硬质合金, WC基体 uncoated carbides based upon WC
	HT	非涂层硬质合金, TiC/TiN-基体 (金属陶瓷) uncoated carbides based upon TiC/TiN (Cermets)
	HF	细微颗粒硬质合金 micro grane carbides
	HC	涂层硬质合金/金属陶瓷 coated carbides / cermets
陶瓷 Ceramic cutting material	CA	氧化物陶瓷, Al ₂ O ₃ -基体 Oxide ceramics based upon Al ₂ O ₃
	CM	混合陶瓷, Al ₂ O ₃ + 金属碳化物-基体 Mixed ceramics based upon Al ₂ O ₃ + metal carbide
	CN	氮化物陶瓷, Si ₃ N ₄ -基体 Nitride ceramics based upon Si ₃ N ₄
	CC	涂层陶瓷 Coated ceramics
金刚石 Diamond	DM	单晶金刚石 (MCD) Monocrystalline diamond (MCD)
	DP	立方金刚石 (PCD) Polycrystalline diamond (PCD)
氮化硼 Boron nitride	BN	立方氮化硼 (CBN) Polycrystalline, cubic boron nitride (PCBN)
